

Mercury

Hg (Hg I). Strongest classified transitions below 2 μm (NIST): 27 levels, 47 lines.

Hg + ionisation limit 84184.15 cm⁻¹ = 10.43750 eV (118.787 nm)

Arrow label: vacuum wavelength | reduced dipole matrix element $|(U||er||J')|$ in $e a_0$
Matrix elements are measured or NIST values; * = high-accuracy theory, ≈ = model calculation.
Arrow width grows with the Einstein coefficient A. Dotted: forbidden (clock, M1, E2). Dashed: Rydberg excitation, $n = 70$.
Level caption: energy (NIST, or a measurement of the last 20 years where one exists) and measured lifetime (where one exists).

λ, ν from NIST level energies unless a measured frequency for this isotope is available. A: measured value or NIST.
Γ/2π: natural linewidth of the upper level, 1/(2πτ).

201Hg hyperfine structure (I = 3/2)

Level	A (MHz)	B (MHz)	Shift of each F level from the centre of gravity (MHz)
