

Krypton

Kr (Kr I). Strongest classified transitions below 2 μm (NIST): 45 levels, 84 lines.

Kr⁺ ionisation limit 112914.43 cm⁻¹ = 13.99961 eV (88.563 nm)

Arrow label: vacuum wavelength | reduced dipole matrix element $\langle J || er || J' \rangle$ in ea0
Matrix elements are measured or NIST values; * = high-accuracy theory, ≈ = model calculation.
Arrow width grows with the Einstein coefficient A. Dotted: forbidden (clock, M1, E2). Dashed: Rydberg excitation, n = 70.
Level caption: energy (NIST, or a measurement of the last 20 years where one exists) and measured lifetime (where one exists).

Key transitions

λ, ν from NIST level energies unless a measured frequency for this isotope is available. A: measured value or NIST.
Γ/2π: natural linewidth of the upper level, 1/(2πτ).

Isotope shifts
