

⁸⁸Sr (Sr I), nuclear spin $I = 0$. Energy levels and transitions below 2 μm : 40 levels, 70 lines.
 Sr⁺ ionisation limit 45932.20 $\text{cm}^{-1} = 5.69487 \text{ eV}$ (217.712 nm)

Sr⁺ ionisation limit 45932.20 cm⁻¹ = 5.69487 eV (217.712 nm)

Arrow label: vacuum wavelength | reduced dipole matrix element $|U|e|r||U|$ in $e a_0$
 Matrix elements are measured or NIST values; * = high-accuracy theory, $\approx$ = model calculation.
 Arrow width grows with the Einstein coefficient A. Dotted: forbidden (clock, M1, E2). Dashed: Rydberg excitation, $n = 70$.
 Level caption: energy (NIST, or a measurement of the last 20 years where one exists) and measured lifetime (where one exists).

λ , ν from NIST level energies unless a measured frequency for this isotope is available. A: measured value or NIST. $\Gamma/2\pi$: natural linewidth of the upper level. $1/(2\pi\tau)$.
