

Terbium

Tb (Tb I). Strongest classified transitions below 2 μm (NIST): 15 levels, 10 lines.

Tb³⁺ ionisation limit 47295.00 cm⁻¹ = 5.86383 eV (211.439 nm)

Arrow label: vacuum wavelength | reduced dipole matrix element $\langle U || e r || U' \rangle$ in ea_0
 Matrix elements are measured or NIST values; * = high-accuracy theory, $\approx$ = model calculation.
 Arrow width grows with the Einstein coefficient A. Dotted: forbidden (clock, M1, E2). Dashed: Rydberg excitation, $n = 70$.
 Level caption: NIST energy and measured lifetime (where one exists).
